

This is part of **Win16 API** which allow to create versions of program from one source code to run under OS/2 and Win16. Under OS/2 program can be running under Win-OS/2 if program is Windows NE executable, and with help on Windows Libraries for OS/2, if it is OS/2 NE executable. Here is a WLO to OS/2 API mapping draft

LocalInit

Brief

Initializes a local heap within a specified memory segment.

Syntax

```
BOOL WINAPI LocalInit(
  WORD  wSegment,
  WORD  wOffset,
  WORD  wHeapSize
);
```

Parameters

- **wSegment** - The selector of the segment in which to initialize the local heap.
- **wOffset** - The offset within the segment at which the heap should start.
- **wHeapSize** - The size, in bytes, of the heap to initialize.

Return Code

- Returns **non-zero** if the heap is successfully initialized.
- Returns **0** if initialization fails.

Notes

- The function sets up a local heap manager within the provided segment, enabling local memory allocation functions to operate within that segment.
- Applications typically call LocalInit during initialization of a data segment or a dynamically allocated memory block intended for use as a local heap.
- First 16 bytes of segment used as system data area.

Example Code

C Binding

```
#include <windows.h>

BOOL WINAPI InitializeLocalHeap(WORD seg, WORD offset, WORD size) {
    return LocalInit(seg, offset, size);
}
```

MASM Binding

```
; Assume AX = segment, DX = offset, CX = heap size
push ax          ; wSegment
push dx          ; wOffset
push cx          ; wHeapSize
call LocalInit   ; Returns AX = non-zero if success
```

See also

- DGROUP, Local Heap and Atom Table
- LocalAlloc - Allocates memory from the local heap.
- LocalFree - Frees memory allocated from the local heap.
- LocalSize - Retrieves the size of a local memory block.
- LocalReAlloc - Reallocates a local memory block.
